

# AMMs

Constant product AMMs.

Automated Market Makers

$$y x = K$$

$\equiv$   
 $C_{\text{mer}}$

At swap

$$y x = K$$

$$(25000 + 5000)(5 + \Delta n) = 125000$$

$$\Delta n = \frac{125000}{30000} - 5$$

$$\Delta n \approx 0.833$$

$\equiv$   
 $C_{\text{mer}}$

$$\text{Price of dai to ether} = \frac{5000}{0.833} = 6000$$

> K does not move during a swap.

Providing Liquidity

$$5 \text{€} \mid 25000 \text{ DAI} \quad 5 \text{ LP}$$

$$+ 5 \text{€} \mid 25000 \text{ DAI}$$

$$\text{LP tokens received} = \frac{\text{token deposited}}{\text{token in pool}} \times \text{LP token supply}$$

$$\frac{5 \text{€}}{5 \text{€}} \times 5 = 5 \text{ LP}$$

$$\frac{25000 \text{ D}}{25000 \text{ D}} \times 5 = 5 \text{ LP}$$

Swaps After adding liquidity

$$10 \text{€} \mid 50,000 \text{ D}$$

$$(10) (50,000) = 500,000$$

$$(10 - dx) (50,000 + 5000) = 500,000$$

$$dx = \frac{500,000}{55,000} - 10$$

$$dx \approx 0.909$$

Price of Dai to Ether =  $\frac{5000}{0.909} \approx \$560$

Higher Liquidity = better Asset Price.

# Impervment Loss

Pool State T, 10  $\equiv$  | 50,000 D SLP / 10 LP

my share      total supply

$T_2$  is  $\equiv 133,000 D$   
 $\equiv$  price  $\approx 2,222$  USD.

$$7.5 \times 2,222 + 16.666 = \$33,333$$

$$T_3 \text{ } \$ = 2,222 + 25,000 = \$ 36,110$$

Impermanent loss  $= 36,110 - 33,333 = \$2,777$
